

# Project Release Notes

Release 3.8 (August 2021)

# Release summary

Release 3.8 is focused on bug fixes and optimization. Click [here](#) for information on issues fixed in this release.

# Fixed issues

The following customer issues are fixed in this release:

Issue ID	Product area	Issue description
CD-1806	Web client	If users signed in to the app using SSO, they were not able to access data in other data sources such as Oracle.
CD-1890	Web client	In Edit action, changes made to child sections using the Actions button were lost when the record was saved.
CD-1909	Web client	It took more than 40 seconds to save changes to records in Edit actions if the change triggered any EDA rules (Save actions) that used the external APIs.
CD-1918	Web client	Saving any date values on the Oracle data source, using external APIs resulted in an error due to incorrect date format. The date value is now converted to Oracle compatible format before saving.
CD-1928	Template designer	Date values appearing in the PDF reports generated in Sign actions were reduced by a day from the actual value in the record.
CD-1933	Studio	Actions configured to be hidden were visible on the record's Actions panel even when the record matched the 'Hide when' condition.
CD-1953	Web client	No records appeared in List actions if included any criteria based on USERINFO literal and the user details fields for the matched user were empty.

CD-1954	iPad	Executing data sharing rules caused an error if the rule's query used table joins, and its results were ambiguous.
